

Hand Wipes in the Corporate Office

Written By Bradley Fowler, MA, MS

Quite often when a spill is left behind in the office, many reach for hand wipes, and quickly remove the mess. However, too often, using hand wipes can leave behind streaks and germs. The texture of some desk top surfaces are not compatible with the chemicals and oils found in many disinfectant wipes. This impacts the visual appearance of cleanliness.

The pathogens found in hand wipe residue can spread, if not sanitized correctly. The Environmental Protection Agency, has prepared policies and models to mirror, to combat the spread of germs. Adhering to these ethics and policies, can reduce the impact of human error and the spread of germs and bacteria.

Hand wipes in the office can also create a plumbing issue, if disposed improperly. Hand wipes should not be flushed in toilets. Doing so can cause a system back-up. Proper disposal should be a waste basket that is emptied daily. Leaving moist towels in the trash with paper creates a mildew order.

Allen Maintenance Corporation thrives to comply with disinfectant usage policies, developed by the ISSA- Worldwide Cleaning Association. Doing so decreases the number of complaints filed against this, Lincoln Park, MI. corporation.

Now is the time to partner with a corporation who cares about the results each client receives. Allen Maintenance Corporation, renders services with a quality assurance. Available seven days a week, excluding federal holidays.
